IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) A method for tracking a transmission status of one or more data elements to one or more <u>routing</u> devices, comprising:

providing a list including one or more <u>routing</u> devices and one or more data elements, wherein each data element includes a routing entry in a routing table;

processing the list to determine a data element of said one or more data elements to transmit to a <u>routing</u> device of one of the one or more <u>routing</u> devices; and

upon successfully transmitting the data element to the <u>routing</u> device, adjusting the list so that the list indicates that the <u>routing</u> device has received the transmitted data element.

- 2. (Currently Amended) The method of claim 1, wherein the operation of providing [[a]] the list includes forming a linked list between the data elements and the <u>routing</u> devices.
- 3. (Currently Amended) The method of claim 1, wherein operation of providing [[a]] the list further comprises:

providing a global version number;

providing a local version number associated with each <u>said</u> data element in the list; and providing a local version number associated with each <u>said routing</u> device in the list.

- 4. (Currently Amended) The method of claim 3, wherein when [[a]] the data element is added to the list, the local version number associated with the data element is set to a value of an incremented global version number.
- 5. (Currently Amended) The method of claim 3, wherein the local version number associated with [[a]] the routing device in the list is set to an initial value of zero.

Title: METHOD FOR TRACKING TRANSMISSION STATUS OF DATA TO ENTITIES SUCH AS PEERS IN A NETWORK

6. (Currently Amended) The method of claim 3, wherein the local version number associated with [[a]] the routing device in the list is set to an initial value of zero and is reset to the local version number of [[a]] the data element after the data element is successfully transmitted to the routing device.

7. (Currently Amended) The method of claim 3, wherein the operation of providing [[a]] the list further comprises:

providing a pointer to a start of the list; and providing a pointer to an end of the list.

- 8. (Currently Amended) The method of claim 7, further comprising: adding a data element to the end of the list; and incrementing the global version number.
- 9. (Currently Amended) The method of claim 7, further comprising: adding a <u>routing</u> device to the beginning of the list.
- 10. (Currently Amended) The method of claim 3, wherein the operation of processing the list further comprises:

locating [[a]] the routing device in the list which is nearest to a start of the list; obtaining [[the]] a version number for the routing device; and comparing the version number to the global version number to determine if the routing device should have [[a]] the data element transmitted to the routing device.

- 11. (Currently Amended) The method of claim 10, wherein the comparing operation determines that the <u>routing</u> device should have [[a]] <u>the</u> data element transmitted to the <u>routing</u> device if the version number of the <u>routing</u> device is not equal to the global version number.
- 12. (Currently Amended) The method of claim 1, wherein operation of adjusting the list further comprises:

Page 4

repositioning the <u>routing</u> device within the list adjacent to the data element and closer to an end of the list than the data element.

13. (Currently Amended) The method of claim 3, wherein the operation of adjusting the list further comprises:

resetting the local version number of the <u>routing</u> device to be equal to the local version number of the transmitted data element.

14. (Currently Amended) A method for transmitting one or more data elements to one or more <u>routing</u> devices, comprising:

providing a list including one or more <u>routing</u> devices and one or more data elements, wherein each data element includes a routing entry in a <u>routing table</u>;

processing the list to determine a data element of said one or more data elements to transmit to a <u>routing</u> device of one of the one or more <u>routing</u> devices;

transmitting the data element to the routing device; and

adjusting the list to indicate that the <u>routing</u> device has received the transmitted data element.

- 15. (Currently Amended) The method of claim 14, wherein operation of providing [[a]] the list includes forming a linked list between the data elements and the routing devices.
- 16. (Currently Amended) The method of claim 14, wherein the operation of providing [[a]] the list further comprises:

providing a global version number;

providing a local version number associated with each <u>said</u> data element in the list; and providing a local version number associated with each <u>routing</u> device in the list.

17. (Currently Amended) The method of claim 16, wherein the local version number associated with [[a]] the data element in the list is set to a value of the global version number at a time when the data element was added to the list.

Dkt: 1370.121US2

- 18. (Currently Amended) The method of claim 16, wherein the local version number associated with [[a]] the routing device in the list is set to an initial value of zero.
- 19. (Currently Amended) The method of claim 16, wherein the operation of processing the list further comprises:

locating [[a]] the routing device in the list which is nearest to a start of the list; obtaining the version number for the routing device; and comparing the version number to the global version number to determine if the routing device should have a data element transmitted to the routing device.

- 20. (Currently Amended) The method of claim 19, wherein the comparing operation determines that the <u>routing</u> device should have [[a]] <u>the</u> data element transmitted to the <u>routing</u> device if the version number of the <u>routing</u> device is not equal to the global version number.
- 21. (Currently Amended) The method of claim 14, wherein the operation of adjusting the list further comprises:

repositioning the <u>routing</u> device within the list adjacent to the data element and closer to an end of the list than the data element.

22. (Currently Amended) The method of claim 16, wherein the operation of adjusting the list further comprises:

resetting the local version number of the <u>routing</u> device to be equal to the local version number of [[the]] <u>a</u> transmitted data element.

23. (Currently Amended) A router, comprising:

a module for providing a list including one or more <u>routing</u> devices and one or more data elements, wherein each data element includes a <u>routing</u> entry in a <u>routing</u> table;

Title: METHOD FOR TRACKING TRANSMISSION STATUS OF DATA TO ENTITIES SUCH AS PEERS IN A NETWORK

a module for processing the list to determine [[a]] the data element of said one or more data elements to transmit to a routing device of one of the one or more routing devices; a module for transmitting the data element to the routing device; and a module for adjusting the list so that the list indicates that the routing device has received the transmitted data element.
